User Journey

Qr Code Restaurant Menu Maker and Contactless Table Ordering System with Restaurant POS Efficient and Easy Digital Menu Ordering and Contactless Payment System for In-House Dining.

QR Code Menu Maker

This feature allows restaurants to create digital menus in the form of QR codes. Restaurants can input menu items, descriptions, prices, and possibly images into a system. The system generates a QR code for each table or the entire restaurant. Contactless Table Ordering System Customers can use their smartphones to scan the QR code on their table, which directs them to the digital menu. The digital menu allows customers to browse through items, select their choices, and place orders directly from their devices. Orders are sent to the kitchen or bar, reducing the need for physical menus, paper order slips, and direct interaction with waitstaff.

Restaurant POS Integration

Integration with the restaurant's POS system ensures that orders placed through the contactless system are seamlessly processed. The POS system may also handle payment processing, allowing customers to pay through the app or other contactless methods.

Frontend Features

1. Home Page
 1. Language switch
 2. Search item
 3. Menu-wise item search (Category)
 4. Veg/Non-veg wise item search
 5. Newsletter subscription
